

Complete WhatsApp AI Setup Guide

From the first browser URL to a live AI reply—every route, field, button and success check in one illustrated walkthrough.

Built from the working production setup

This manual uses the real Meta and VerityCore AI screens. Security values are hidden, but navigation, labels, IDs and the configuration flow remain visible so you can follow them exactly.

Receiving

Healthy

AI replies active

What you need before starting

Allow 30–60 minutes for setup. Meta’s business or display-name review can take longer.

- ✓ A Meta/Facebook account with administrator access to your organisation’s Meta Business Portfolio.
- ✓ A business website with real Privacy Policy, Terms of Service and Data Deletion pages.
- ✓ A square 1024 × 1024 app icon and a monitored business contact email.
- ✓ A phone number that can receive an SMS or voice verification code and can be registered on the WhatsApp Business Platform.
- ✓ An active VerityCore AI workspace with permission to manage WhatsApp.

Never share these three values: Meta Access Token, Meta App Secret and your Verify Token. Store them in a password manager. If one is exposed, revoke or rotate it immediately.

The setup sequence

Stage	Where	Result
1. Create app	Meta for Developers	A Business app with the Connect on WhatsApp use case.
2. Complete app details	App settings → Basic	Valid business URLs, contact email, icon and category.
3. Register number	Use cases → Production setup	Registered phone, Phone Number ID and WABA ID.
4. Save credentials	VerityCore AI → WhatsApp	Channel saved with signature verification enabled.
5. Configure webhooks	Meta → Configure Webhooks	Verified callback, <code>messages</code> field and WABA subscription.
6. Publish and test	Meta + a different phone	VerityCore AI shows Receiving / Healthy and sends an AI reply.

About identifiers: App ID, Phone Number ID and WABA ID are required for setup. This guide hides actual security credentials, not the operational IDs users need to recognise.

Open Meta for Developers and create the app

Start URL — type this into your browser:

<https://developers.facebook.com/>

- 1 Click **Log In** and use the Meta account that administers your business.
- 2 Click **My Apps** in the top navigation.
- 3 Click **Create App**. Choose the Business use case and select **Connect on WhatsApp** when Meta asks what the app should do.
- 4 Enter a clear app name, choose the correct Business Portfolio, add your contact email and complete app creation.
- 5 Open the new app. Confirm that **Connect on WhatsApp** appears in the use-case selector.

Route after login:

My Apps → Create App → Business → Connect on WhatsApp

Do not continue until

- ✓ The app is owned by or connected to the correct Business Portfolio.
- ✓ You can see Dashboard, Required actions, Use cases, Publish and App settings in the left menu.
- ✓ You know which WhatsApp Business Account and number belong to this workspace.

Meta changes labels occasionally. If “Connect on WhatsApp” is not shown during creation, create a Business app first and add the WhatsApp use case from its dashboard.

Complete the app's Basic settings

Click path:

My Apps → [your app] → App settings → Basic

- 1 Confirm the **Display name** and **Contact email**.
- 2 Add your SaaS domain under **App domains** without `https://` or a page path.
- 3 Enter real, public URLs from your own **Privacy Policy**, **Terms of Service** and **User data deletion**. Do not use Facebook's homepage as a placeholder.
- 4 Upload a square **1024 × 1024** PNG or JPG app icon, select a category and click **Save changes**.
- 5 Copy the **App Secret** only when you are ready to paste it into VerityCore AI.

Currently ineligible for submission
Your submission is missing data in the following fields:

- App icon (1024 x 1024)

App ID
4072075213092775

App secret
..... [Show](#)

Display name
verity_ai

Namespace

Category ⓘ
Utility and productivity

Actual Meta screen: App settings → Basic. The App Secret is already masked. The screenshot shows incomplete/placeholder fields; your production app must use your own valid business URLs and icon.

Register your WhatsApp phone number

Click path:

My Apps → [your app] → **Use cases** → **Connect on WhatsApp** → **Customize** → **Basic setup** → **Step 2. Production setup**

- 1 Under **Register your WhatsApp phone number** , choose the correct WhatsApp Business Account.
- 2 Add the business number, select SMS or voice verification, enter the code and finish registration.
- 3 Wait until the phone shows **Registered** .
- 4 Copy the **Phone Number ID** displayed below the number.
- 5 Copy the **WhatsApp Business Account ID** displayed below the business name. This is the WABA ID.
- 6 Turn on **Subscribe webhooks** for this exact WABA.

Actual Meta screen: the correct WABA shows the registered number, Phone Number ID and blue Subscribe webhooks toggle. If several WABAs appear, match the business and phone carefully.

Generate the Meta access token

Click path:

Use cases → Connect on WhatsApp → Customize → Step 2. Production setup → Send Message → Generate token

- 1 Click **Generate token** and authorise the correct business and WABA.
- 2 For production, use a System User/permanent token—not a short-lived “Try it out” token.
- 3 The token needs `whatsapp_business_management` and `whatsapp_business_messaging`.
- 4 Copy it directly into a password manager, then into VerityCore AI. Never expose it in email, screenshots or chat.
- 5 The registered number shown here must match the number and Phone Number ID entered in VerityCore AI.

A temporary token may work during setup and stop later. Before launch, confirm the production token belongs to the same app, has both WhatsApp permissions and has access to the correct WABA.

Sign in to VerityCore AI

Customer sign-in URL:

<https://saasai.veritypack.cloud/verityai/signin>

- 1** Open the URL above and sign in with your VerityCore AI account.
- 2** Select the workspace that owns the WhatsApp business number.
- 3** In the left menu, scroll to **Operations** and click **WhatsApp**.
- 4** You may use the direct route below after signing in. Replace `YOUR-WORKSPACE` with the workspace slug from your portal URL.

Direct WhatsApp route:

<https://saasai.veritypack.cloud/verityai/whatsapp?workspace=YOUR-WORKSPACE>

Have these values ready

Business number

International format, such as +263...

Phone Number ID

From Meta Production setup.

WABA ID

WhatsApp Business Account ID.

Access token

Production/System User token.

App Secret

App settings → Basic.

Verify token

A random secret you create.

You create the Verify token. Meta does not issue it. Generate a long random value, keep it private and use the exact same value in VerityCore AI and Meta.

Complete the VerityCore AI channel

Click path:

VerityCore AI → Operations → WhatsApp → Channel configuration

- 1 Set **Mode** to **Full AI Automation**.
- 2 Enter the **Business WhatsApp number**, **Meta phone number ID** and **WhatsApp Business Account ID**.
- 3 Open **Meta credentials**. Paste the Access Token, your random Verify Token and the App Secret.
- 4 Keep **Verify every Meta webhook signature** selected.
- 5 Click **Save channel**. Secret inputs clear after saving; this does not mean they were deleted.
- 6 On the right, click **Copy URL** under Webhook endpoint.

WhatsApp AI Early Access

WhatsApp channel
An inbound WhatsApp event was processed recently. Receiving Healthy

Channel configuration
Connect the business number and choose how the assistant participates.

Experience

Mode: Full AI Automation Business WhatsApp number: +263780297586

Meta phone number ID: 1324702534061120 WhatsApp Business Account ID: 2087647528457611

Meta credentials

Access token: Verify token:

App secret:

☒ Verify every Meta webhook signature

Test Meta API Subscribe WABA Save channel

Webhook endpoint
Use this callback URL in Meta and subscribe the app to the messages field.

Copy URL
`https://saasai.veritypack.cloud/api/method/verity_ai.api.whatsapp.webhook`

Meta API: Not tested

WABA subscription: Requested

Webhook configuration: Ready

Signature verification: Active

Inbound messages: Receiving

Actual VerityCore AI screen. Operational IDs remain visible; the credential inputs expose no security keys. Copy the callback URL from the right panel.

Verify the callback URL in Meta

Click path:

Meta app → Use cases → Connect on WhatsApp → Customize → Basic setup → Step 2. Production setup → Configure Webhooks

- 1 Paste the URL copied from VerityCore AI into **Callback URL** . Do not type it manually.
- 2 Paste the exact same secret used in VerityCore AI into **Verify token** . It is case-sensitive.
- 3 Leave **Attach a client certificate** off unless your organisation configured mTLS.
- 4 Click **Verify and save** . Meta should accept the callback.
- 5 If it fails, save the VerityCore AI channel again and re-check the full URL and Verify token.

Actual Meta screen: Callback URL and masked Verify token. The warning confirms that an unpublished app does not receive real production data.

Subscribe the messages webhook field

Click path:

Production setup → Configure Webhooks → Webhook fields → messages → Subscribe

- 1 After Meta verifies the callback, scroll down to **Webhook fields**.
- 2 Find the exact row **messages**. Do not confuse it with similarly named template/status fields.
- 3 Turn its **Subscribe** switch on.
- 4 Optional: click **Test** on the **messages** row to send a dashboard test payload.
- 5 Return to the registered-number section and confirm **Subscribe webhooks** remains blue/on for the correct WABA.

Step 1. Try it out

Step 2. Production setup

Step 3. Business verification

About 3 minutes to complete

Set up a Webhooks endpoint to get notified about incoming messages and status updates. [How to configure Webhooks](#)

⚠ Apps will only be able to receive test webhooks sent from the app dashboard while the app is unpublished. No production data, including from app admins, developers or testers, will be delivered unless the app has been published. [Publish your app](#)

Callback URL ⓘ

https://saasai.veritypack.cloud/api/method/verity_ai.api.whatsapp.webhook

Verify token ⓘ

.....

☐ Attach a client certificate to Webhook requests. [Learn more.](#)

[About certificates](#)

Webhook fields ⓘ

Field	Version	Test	Subscribe
messages			☒

Actual Meta screen: scroll below Callback URL to Webhook fields and subscribe **messages**. The Verify token is already masked.

A verified callback is not enough. Without the **messages** subscription, customers can see delivery ticks while VerityCore AI receives nothing and cannot reply.

Confirm the WABA subscription

Meta route:

Production setup → Register your WhatsApp phone number → Subscribe webhooks

VerityCore AI route:

Operations → WhatsApp → Subscribe WABA

- 1 In Meta, the correct WABA's **Subscribe webhooks** switch should be blue/on.
- 2 In VerityCore AI, click **Subscribe WABA** . Meta may briefly report the request as pending even when its dashboard toggle is on.
- 3 Click **Test Meta API** . Success confirms the token, app, Phone Number ID and permissions can reach Meta.
- 4 If several WABAs are listed, confirm the enabled one contains your registered number.

The screenshot shows the Meta WhatsApp Business dashboard. The left sidebar contains navigation icons. The main content area displays a list of WABAs (WhatsApp Business Accounts) with their respective subscription status. The first WABA, 'VerityCore Consultancy' with WhatsApp Business account ID 2087647528457611, has a 'Subscribe webhooks' toggle switch turned on (blue). Below it, another WABA with ID 1998158044424692 has the toggle switch turned off (grey). The dashboard also shows a 'Register your WhatsApp phone number' section with a 'Registered' status and a 'Not registered' status.

Actual Meta screen: the correct registered number sits under the WABA whose Subscribe webhooks switch is on.

“Requested” is not the final test. A real inbound message and AI reply are the authoritative proof that the webhook route works.

Publish the Meta app

Click path:

Meta app → Required actions → complete all items → Publish

- 1 Open **Required actions** and complete every blocker: real business URLs, app icon, contact details, business verification and any requested review.
- 2 Open **Publish** in the left menu and follow Meta's prompts to set the app Live.
- 3 Return to Production setup and confirm the unpublished-app warning is gone.
- 4 Recheck that the callback is verified, **messages** is subscribed and the WABA toggle remains on.

Actual Meta warning: while unpublished, the app receives dashboard test webhooks only. Real customer messages are not delivered to VerityCore AI.

This was the decisive production issue in the working setup. Delivery ticks do not prove that an unpublished Meta app delivered a webhook. Publish before the real customer-message test.

Run the end-to-end test

- 1 Use a **different personal WhatsApp number** . Never message the registered business number from itself.
- 2 Send "Hello" to the registered business number.
- 3 Wait a few seconds. The VerityCore AI assistant should reply in WhatsApp.
- 4 Refresh the VerityCore AI WhatsApp page. It should show **Receiving** and **Healthy** .
- 5 Open **Sales → Conversations** and confirm the new conversation uses the workspace's assistant and knowledge.

Actual working state: a recent inbound event was processed and the channel shows Receiving / Healthy.

✓ Setup complete

A message from another phone received an AI reply, and the portal shows Receiving / Healthy.

24-hour service window: after a customer messages you, normal replies are allowed during the service window. Business-initiated messages outside it generally require an approved WhatsApp template.

Fix the common failure states

What you see	Cause	Correction
Two ticks, no AI reply, "Awaiting event".	Inbound webhook was not delivered.	Publish the app; subscribe <code>messages</code> ; enable the correct WABA toggle.
Callback verification fails.	Wrong callback or Verify token.	Copy the URL from VerityCore AI and use the same case-sensitive Verify token in both systems.
Meta API permissions error.	Wrong/expired token or missing access.	Create a production System User token with both permissions and correct app/WABA access.
Signature verification fails.	Wrong App Secret.	Use the App Secret from the same Meta app. Never leave signature verification disabled.
WABA stays Requested.	Listing delayed or IDs mismatch.	Check Meta's toggle, confirm IDs, then send a real inbound message.
Replies worked, then stopped.	Temporary token expired.	Replace it with a production System User/permanent token.
Wrong business receives events.	Mixed Phone Number/WABA IDs.	Match business, number, Phone Number ID, WABA ID, app and token.

Security and handover checklist

- ✓ Access Token, Verify Token and App Secret are stored only in a password manager and VerityCore AI.
- ✓ Webhook signature verification remains enabled.
- ✓ The Meta app is Live and all Required actions are complete.
- ✓ The `messages` field and correct WABA are subscribed.
- ✓ The production test came from another phone and resulted in Receiving / Healthy.

When requesting support, include the workspace, approximate time and visible error—but never the Access Token, Verify Token or App Secret.
